Optimizing Hiding Power in Architectural Coatings

Hiding power

Hiding power is the ability of a paint or varnish to cover a background of contrasting color.

Hiding power depends on the layer thickness and can be specified as the quotient of the remission on a white and a black substrate.

Two Ways to Improve Hiding Power in Architectural Coatings

Coating Additives Solutions for Architectural Coatings

Additives for Dispersion Production

Additives for each step of dispersion paint production offer a variety of possibilities to improve the processing of paints & coatings

Specialty Fillers

TiO₂-Extenders based on Sodium Aluminum Silicates reduce raw material costs without affecting the overall paint properties

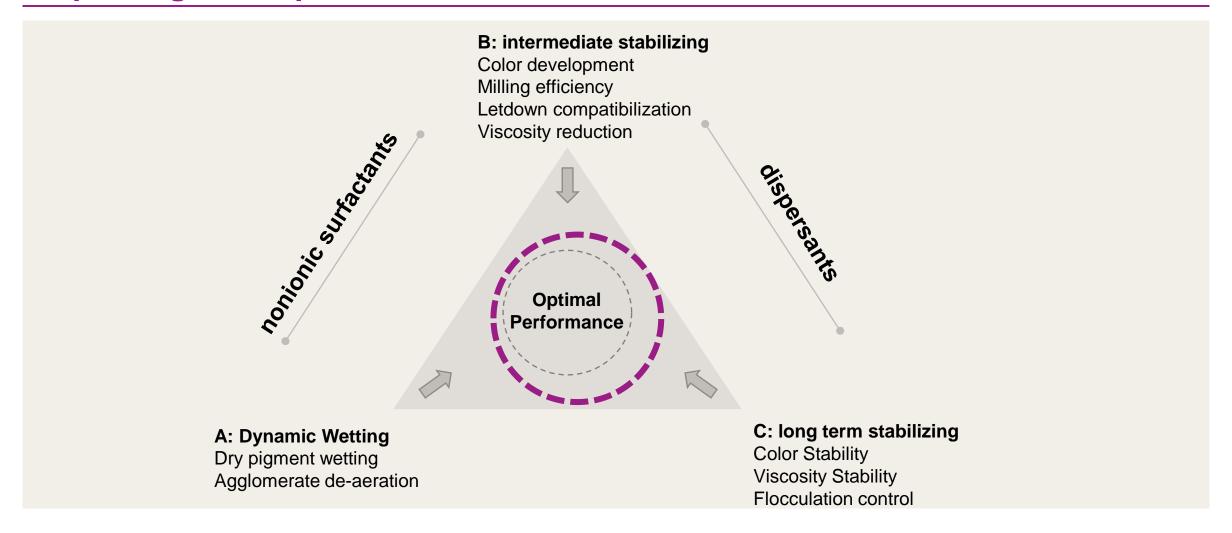

Hiding Power measurement on HTE

- Completly closed imaging box → no scattered light
- Defined and reproducible light parameters
 - exposure time, light-methode
- Shortest time between draw down and imaging: approx. 60 seconds
- Black/white close-up images (4096x3000 pixel)
 - → Constant conditions

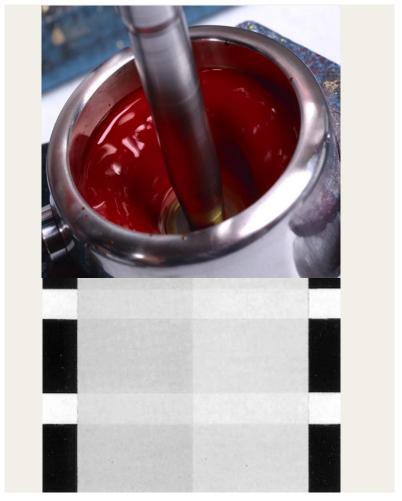

Dispersing Concept

Grind Aid Benefits: Better milling efficiency

Grind Aid Surfactant – Faster wetting

Fast and strong pigment wetting

Results Polyphosphate

Results CARBOWET® GA' series

Test set-up:

A pre-mix of water and additives is prepared by hand-mixing using a spatula. Then the pigments and fillers added to the liquid pre-mix and mixed by hand.

Additive dosage: 0.5% on total paint formulation

Evaluation:

The fluidity of the paste containing Carbowet® GA100 demonstrate the benefits of dynamic pigment wetting

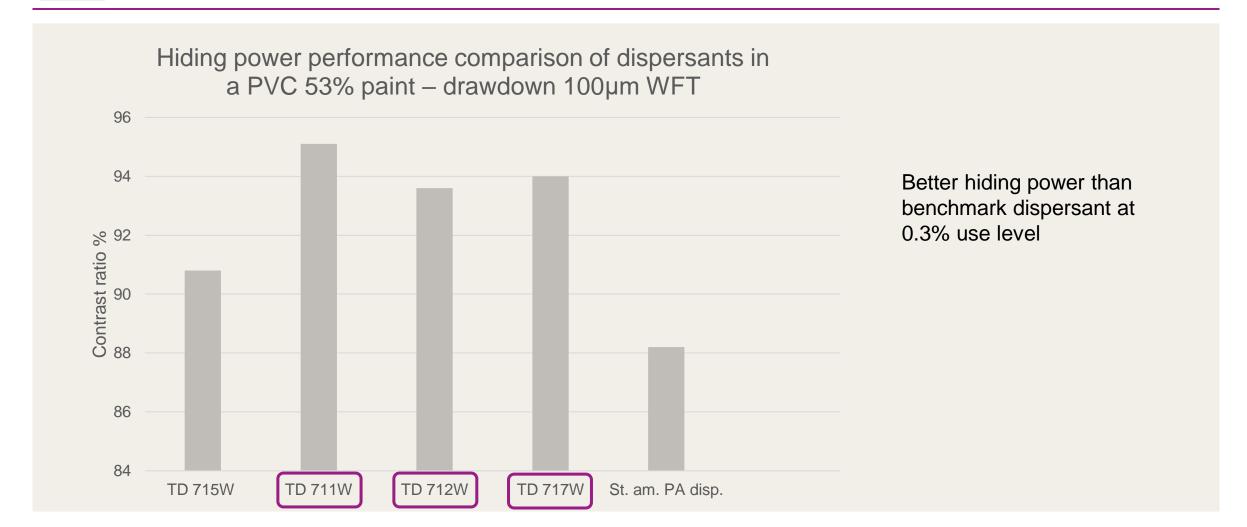

3 New wetting and dispersing additives

TEGO® Dispers 711W, 712W and 717W provide very good hiding power

ZETASPERSE® 179

- Steric stabilization
- Improved dispersion stability
- Lower dispersion viscosities allowing higher pigment loadings
- Enhanced letdown compatibility and color acceptance
- No added APE's or solvents
- No VOC's per European and US regulations
- No added silicone, silica or fluorinated materials

Specifications

Active matter

Nonionic stabilizing surfactant and wetting agent

VOC: approx. 0%(ASTM D6886-14)

Ideal combination:

Regulations

Global Chemical Inventory Status: EINECS, TSCA, DSL, ENCS, AICS, ECL, PICCS, IECSC, TCSI

TEGO® Dispers 747 W

- Economical wetting and dispersing additive for waterborne formulations
- For very good stabilization and high color strength with inorganic pigments, especially with iron oxide pigments

100% Product/Concentrate

Organic

Matting Agents

Filler

() Inorganic

For use in mill base of emulsion paints and architectural paints

Specifications

Active matter

Effectivity > Compatibility
Aqueous solution of a copolymer with
groups of high pigment affinity

VOC: approx.0.1 g/l(DIN ISO 11890/2)

Ideal combination:

Regulations

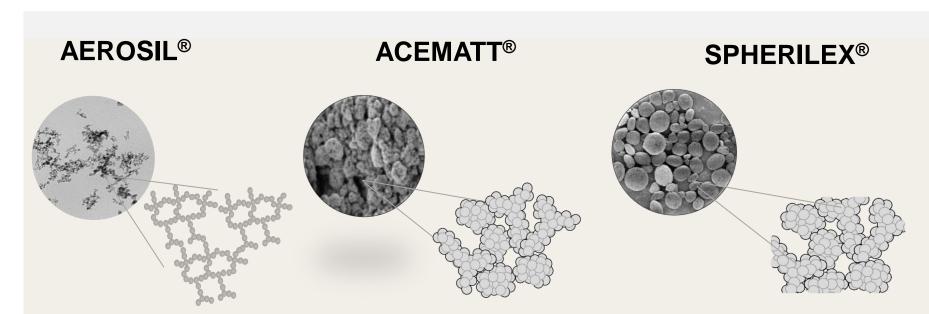

Global Chemical Inventory Status: AICS, EINECS, ECL, TSCA, NZIOC, TCSI, PICCS, DSL

Solution

Carbon Black

SIPERNAT® - Specialty Extenders

Entirely open structure with a high level of surface functionality

- Functions
 - Thickening

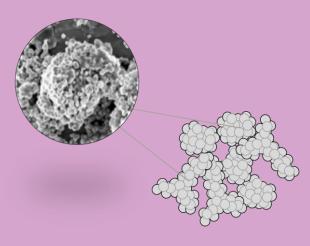

Key Driver: Aggregate Structure Key Driver: Surface Modification Key Driver: Particle Morphology

Porous structure of interconnecting Spherical particle shape conduits

- Functions
 - Matting

- Functions
 - Burnish Resistance

SIPERNAT®

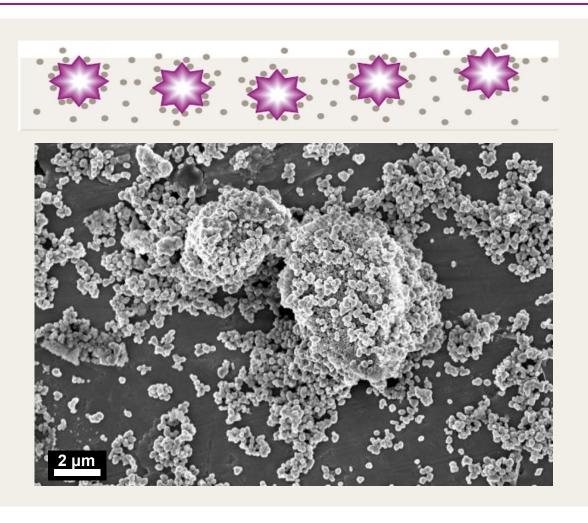

Key Driver: Particle Morphology

Porous structure

- Functions
 - TiO2 spacing

Specialty Extender Spacing Effect

TiO2 has an affinity for the surface of Specialty Extenders

Minimized crowding effects and optimized inter-particle distance

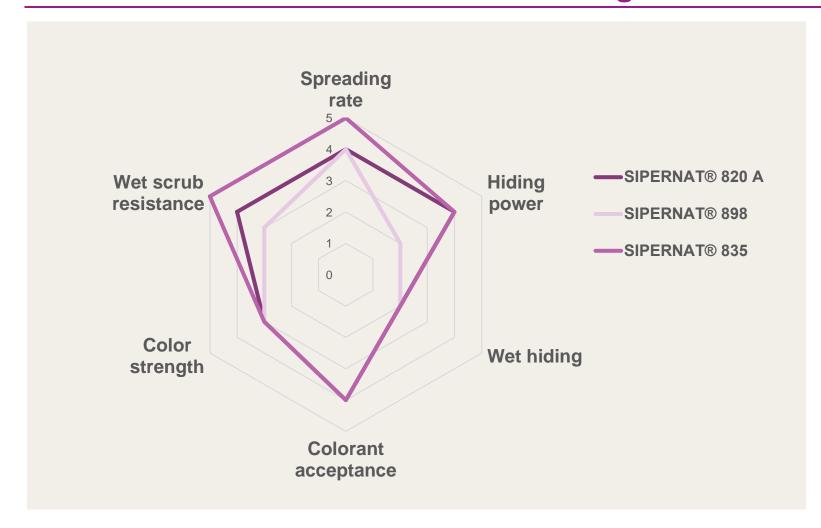

SIPERNAT® and ZEOLEX® with different benefits besides TiO₂ replacement

Property	SIPERNAT® 820 A	SIPERNAT® 898	SIPERNAT® 835
Chemistry	Sodium Aluminum Silicate	Sodium Aluminum Silicate	Sodium Magnesium Aluminum Silicate
Average agglomerate particle size ¹	7.0 µm	6.0 µm	5.0 μm
Specific surface area (BET)	85m ² /g	130m ² /g	80m²/g
pH value, 20% in water	10	7	6
DOA absorption	155ml/100g	85ml/100g	110ml/100g

¹⁾ laser defraction method d₅₀

Performance in Exterior Facade Coating

Test formulation – Europe

Exterior facade coating

PVC: ~75%

Binder: styrene acrylic binder

TiO₂-content: 7.5%

Specialty Extender: 10-30% (v/v% of

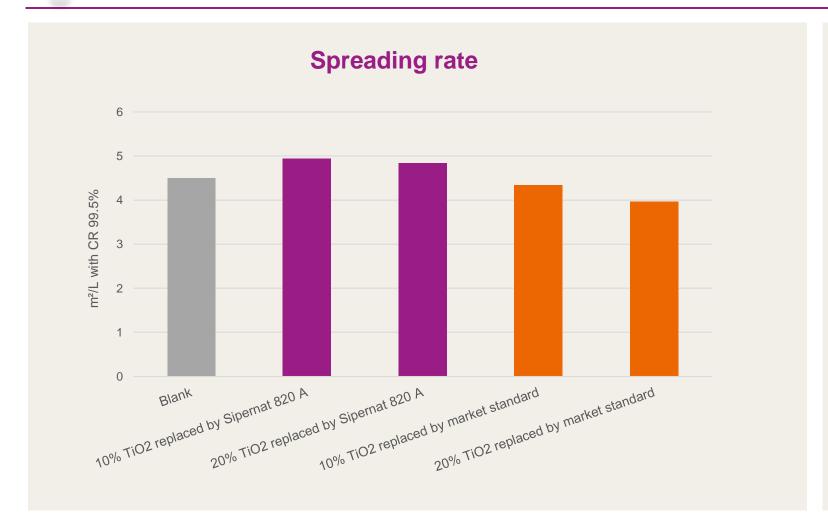

TiO₂ content)

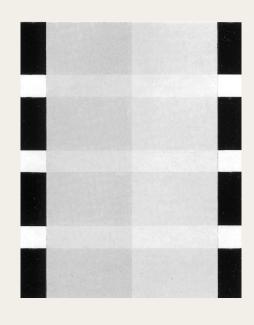

Improved hiding power with SIPERNAT® 820 A

Test Set Up

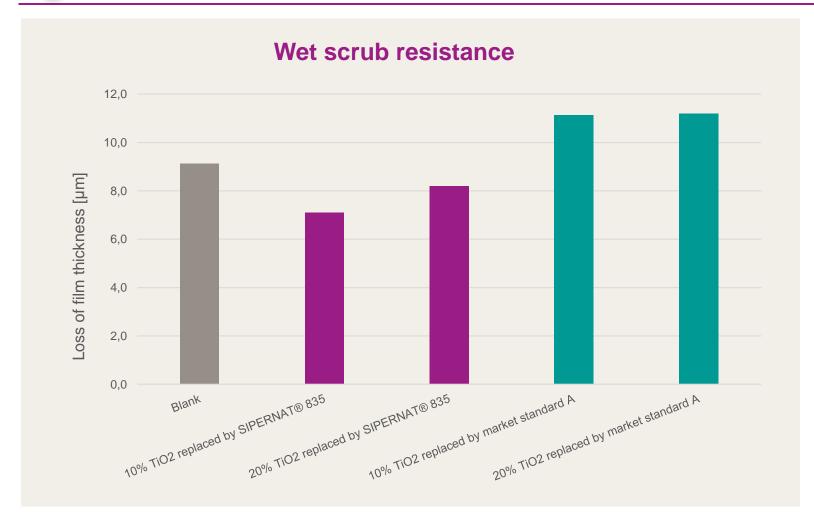

- PVC 75%
- Exterior coating
- 10-20% (volume) replacement of TiO2

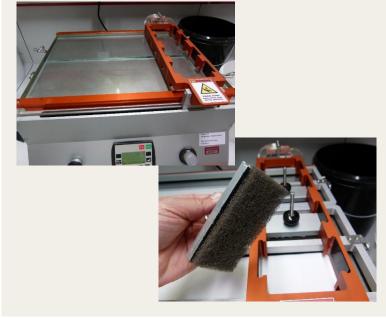

SIPERNAT® 835 improves wet scrub resistance

Test Set Up

- PVC 76%
- Exterior coating
- 10-20% (volume) replacement of TiO2

Benefits of using SIPERNAT®

Perfect dispersion of primary Pigment through effective spacing

- Optimization of TiO2 to maximize opacity
- Enhanced whiteness compared to natural fillers
- Optimization of formulation cost

Other Benefits

- Easy to disperse compared to common extenders Unique morphology and soft particles help easy to grind and wet-ability
- Improved or maintained scrub resistance
- Increased color strength with lower TiO₂ content

Formulation advice

TiO₂ has twice the density of the SIPERNAT®

Wt / Wt replacement results in additional volume gain Replacement of TiO₂ by volume
